

Incident Report Using the NIST CSF

Area	Key Details
Attack	DoS attack caused by a flood of ICMP packets.
Impact	Internal network services were disrupted for about two hours.
Root Cause	Firewall rules were not configured to restrict malicious ICMP traffic.
Response	ICMP traffic was blocked, non-critical services were taken offline, and critical services were restored.
Outcome	Operations were interrupted and the company’s reputation was affected.

Summary

The incident was an ICMP-based denial-of-service attack that disrupted internal network availability due to weak firewall controls.

Identify

The primary issue was a lack of firewall configuration, which allowed malicious traffic to overwhelm network resources.

Protect

The company should enforce ICMP filtering, enable source IP verification, strengthen privileged access, and maintain regular patching and security controls.

Detect

Continuous monitoring, firewall log review, IDS/IPS alerts, and SIEM analysis should be used to identify abnormal traffic quickly.

Respond

A formal incident response plan should support rapid containment, system isolation, evidence collection, and prioritized restoration of critical services.

Recover

Recovery should focus on restoring essential services, validating system stability, communicating with stakeholders, and updating controls after review.

Lessons Learned

This incident highlights the need for stronger preventive controls, better monitoring, and a tested response process.
